**ABSTRACT** — *Charletonia elbasani* n. sp. (Acari: Erythraeidae) is described and illustrated from larvae collected from herbaceous plants on the Elbasan (Albania). It is the eighteenth report of larval species of the genus *Charletonia* with two setae between coxae II and III. New and corrected data for *C. kalithensis* are given.

**KEYWORDS** — Acari; Parasitengona; *Charletonia*; new species; taxonomy; larva

ZOOBANK — [17343A2F-4F7E-47B2-8C73-983C960ECB94](https://doi.org/10.17165/17343A2F-4F7E-47B2-8C73-983C960ECB94)

### INTRODUCTION

The fauna of terrestrial Parasitengona (excluding chiggers) of Albania is poorly studied and only eight species of these mites have been reported from Albania up to now: *Abrolophus silesiacus* (Haitlinger, 1986) (= *A. kotorenensis* Haitlinger, 2007), *Calyptostoma velutinum* (Müller, 1776), *Charletonia krendowskyi* (Feider, 1954) (Haitlinger & Šundić 2014), *Erythraeus (E.) regalis* (C. L. Koch, 1837), *Erythraeus (Z.) budapestensis* Fain & Ripka, 1998 (Haitlinger & Šundić 2015), *E. (Z.) albanicus* Haitlinger, 2012, *Leptus (Leptus) josifovi* Beron, 1975, (Beron 2008, Haitlinger 2012, Haitlinger & Šundić 2014, Haitlinger & Łupicki, 2015) and *Valgorthrombium melindae* Haitlinger, 2008.

In this paper we describe the larvae of the new species *Charletonia elbasani*, collected in Albania, and new and corrected data for holotype of *C. kalithensis* are given.

### MATERIAL AND METHODS

The specimens were collected by a sweep net on grasses and preserved in 75% ethanol. Mite specimens were cleared in Nesbitt's solution and mounted in Faure medium (Walter & Krantz, 2009). All measurements are given in micrometers (µm) and calculated using a Carl Zeiss Axioscope A1 microscope, and Carl Zeiss Axio Imager A2 with differential interference contrast and phase contrast. The terminology and abbreviations follow Haitlinger (1999, 2013).

Zoobank: [6AF7DD31-1492-4E25-86DB-BC37EAAAAA314](https://doi.org/10.1546/zoobank.6AF7DD31-1492-4E25-86DB-BC37EAAAAA314)

**Diagnosis** (n=6) — Two setae between coxae II and III, solenidion on GeI placed distal to the normal setae, ωI long 24 – 28, Ti III 94 – 99, fnTi (16 – 17) – (15 – 16) – (15 – 16), gnathosoma with one pair of barbed galealae (cs), two pairs of nude hypostomaliae (as, bs).

**Description (n=6) — larva.**

Dorsal surface with 72 (64 – 76 in paratypes) slightly barbed and blunted setae (fD); one eye on each side of idiosoma, 11 in diameter (Figure 1A). Scutum pentagonal, punctate entirely and longer than wide. Anterior border almost straight, posterior border convex, except median part which is slightly concave (around Psens bases), lateral borders slightly convex. Scutum with two pairs of sensilla (ASE< PSE) both with short barbs in distal part, and three pairs of normal setae. Scutalae (AL, ML and PL) barbed and pointed, AL as long as ML

and both slightly shorter than PL (Figure 1C). Ventral side of idiosoma with sternaliae 1a, 2a, 3a, all with short barbs, subequal in length. Thirty two weakly barbed setae behind coxae III (fV) (Figure 1B). Coxae I with one barbed seta (1b), coxae II and coxae III each with two barbed setae (2b', 2b'' and 3b', 3b''), which 2b'', 3b'' are blunted and 2b', 3b' are pointed (Figure 2).

NDV = 72 + 32 = 104, (62 – 76 + 28 – 32 = 90 – 108 in paratypes).

Leg segmentation formula: 7-7-7. Leg setal formula: Leg I: Ta-1ω, 1ε, 2ζ, 1Cp, 24n (21 – 24n in paratypes); Ti-2φ, 1κ, 17n (16 – 17 in paratypes); Ge-1σ, 1κ, 12n; TFe-5n, BFe-4n; Tr-1n, Cx-1n. Leg II: Ta-1ω, 2ζ, 22n (20 – 24n in paratypes); Ti-2φ, 16n (15-16n in paratypes); Ge-κ, 12n; TFe-5n, BFe-4n; Tr-1n; Cx-2n. Leg III: Ta-1ζ, 24n (21 – 24n in paratypes); Ti-1φ, 16n (15-16 in paratypes); Ge-12n; TFe-5n, BFe-2n; Tr-1n; Cx-2n (Figure 2). Measurements are given

in Table 1.

Gnathosoma with one pair of barbed galealae (cs), two pairs of nude hypostomaliae (bs, as); bs>as. Palpfemur and palpgenu each with one barbed seta. Palptibia with three barbed and pointed setae (Figure 1D). Palptarsus with one eupathidium, one solenidion, four nude and one barbed seta. Odontus (OD) bifurcate (Figure 1D). fPp = 0-B-BBB-4NBωζ. Cheliceral basis and subcapitulum punctate. Supracoxal seta present, 5 long (Figure 1D).

**Etymology** — The name is derived from the name of the city Elbasan (in Albania), where the species was collected.

**Type material** — Holotype larva, from herbaeous plants in Elbasan (Albania), collected on 15 June 2016; five paratypes with the same data; leg. M. Šundić. The holotype and four paratypes are deposited in the Museum of Natural History, Wrocław University of Environmental and Life Sci-

ences, Wrocław, Poland, one paratype is deposited in Invertebrate collection, Biology Center of the Upper Austrian Museum, Linz, Austria.

**Remarks** — This species belongs to the larval species of the genus *Charletonia* with two setae between coxae II and III. Eighteen species with such character are known hitherto (Haitlinger & Šundić, 2016). Moreover, *Charletonia elbasani* n. sp. belongs to the species group with solenidion on GeI placed distal to the normal setae and Ti III<120. This group includes: *C. kalithensis* Haitlinger, 2006; *C. talebii* Sedghi, Saboori, Hakimitabar, 2010 and *C. blascoi*

Southcott, 1993 (Southcott, 1993, Haitlinger, 2006, Sedghi *et al.*, 2010).

*Charletonia elbasani* n. sp. differs from *C. kalithensis* by the shorter L (58 – 66 vs. 72 – 76), W (56 – 58 vs. 64 – 70), AL (33 – 34 vs. 40 – 42), TiI (78 – 88 vs. 96 – 106), TiII (78 – 88 vs. 98 – 106), TiIII (66 – 75 vs. 86 – 90), TiIII (94 – 99 vs. 114 – 120), PaFe (W) (19 – 23 vs. 38), PaGe (W) (15 – 17 vs. 34), number of normal setae on BFe III (2 vs. 3), presence of κGeII (vs. absent in *C. kalithensis*), the number of NDV (90 – 108 vs. ≈ 124), from *C. talebii* in shorter L (58 – 66 vs. 85 – 99), W (56 – 58 vs. 75 – 80), in longer 1a (32
